claim 16; Fig 1a(i1); 184pp; English.

This polypeptide comprises the VH down of human serv antibody 31G9, which is specific for transforming growth factor (TGF) beta-1. It is encoded by a gene (T60381) isolated from a large beta-1. It is encoded by a gene (T60381) isolated from a large shingle chair for intary. The antibuse-linding decaping of human antibodies (see W1522-44), to TGF beta-1 and/or beta-2 can be used to counter the adverse effects of TGF beta, such as (1) promotion to counter the adverse effects of TGF beta, such as (1) promotion or inhors, in the following attential injury, prohiferative rethnopathy, retinal detachment, adult resplitting distress syndrome. This is the amino acid sequence of the heavy chain variable (Vh) region from the human monoclonal antibody (MAb) PEI-1. The MAb was generated by immunising humans with a hepatitis B virus (HBV) vaccine, isolating by immunishing humans with a hepatitis B virus (HBV) vaccine, isolating be peripheral blood lymphocytes (PEL) and fusing them with a mouse/human compared cell line SPAZ-4. 5 cell lines were isolated: PEI-1, ZMI-1, MD3-4 and LO3-3. The cell lines were then tested for production of a nati-hepatitis B virus surface antigen antibody by ELISA. The MAbs conformatography, size separation on Sephacryl S300 gel and ion exchange chromatography on Q-sepharose. The heavy and light chains of the MAbs choranted and used to amplify cDNA synthesised from RNA purified from generated and used to amplify cDNA synthesised from RNA purified from generated and amino acid sequences of the heavy and light chains contain a mimo acid) from MAbs PEI-1, ZMI-1, ZMI-2 and MD3-4 are contain a mimosuppressed patients or patients with chronic active horatics.

Human volunteers were immunised with hepatitis B varcine. MD1-4, ZM1-

Human volunteers were immunised with hepatitis B vaccine. MD1-4, ZM1-

Hymphocytes of individuals immunised with Heptavax (Merck 6 CO).

Jymphocytes of individuals immunised with Heptavax (Merck 6 CO).

Antibodies PEI-1, ZM1-1, MZ1-2 and MD3-4 belong to the Idd) clus.

Artibodies PEI-1, ZM1-1, MZ1-2 and MD3-4 belong to the Idd) clus.

Artical Innes producing PEI-1, ZM1-1 and ZM1-2 were deposited as ArcK H9234, 9191 and 9192 respectively. The cell lines all behave as typical (mouse x human) x human hybridomas and produce their respective Abs in concs. Iddiiguague to 25 ma/1 in standard suspension culture. The heavy variable (VH) and light variable (LH) channel of Abs Experies and MD3-4 were isolated and concerned.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  20 gyglyesgggyydpgrslrlscaasaftfsrygmhwyrgapykglewyavisydgsnkwy 79

superantigen, heavy chain variable region; VH3 restricted antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequences, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            N-PSDB, 044640.

New engineered antibodies and fusion proteins for preventing plasmodium infection - contg. murine antibody CBR sequences, an corresp. nucleic acid, vectors and transformed cells claim 14; Fig 9; 98pp; English.

Example 4 describes the prodn. of a high affinity humanised antibody. At amino acid position 49; the Ser of the humanised heavy chain Pfhizhc23 was changed to Ala, which is the amino acid found at this position in the native murine NSF2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 674; DB 9; Length 122; Pred, No. 2.72e-43;

Stimulating prodn. of variable region gene family restricted antibodies - through B-cell super-antigen vaccination Disclosure: page 66; 130pp: English
B-cell superantigen (849) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The SAG is used to enhance production of VH; sepecially VH3, restricted Abs. During attempts to identify sAgs, as sequences (R54784-801) of H chains from Ig reactive with mod-SpA, and as and DNA sequences (F74801; GA4402-56) of VH regions of SpA binders obtained from combinatorial libraries were determined. IgM protein 18/2 derives from the germline configuration of VH gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 evgllesggglvqpggslrlscaasgftfssyamswvrqapgkglewvsaisgsggstyy 60

Mean 41.619; Variance 120 293; scale 0 346 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 30.277; Variance 155.246; scale 0.195 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

c antibodies has been produced. The process involves: (a) constructing at antibodies has been produced. The process involves: (a) constructing at antibodies has been produced. The process involves: (a) constructing at antibodies has been produced. The process involves: (a) constructing at the place of the place of the place in the place in the place in the place in a cancer patient; (b) screening for anti-tumour antibodies in the phage library in a binding assay with cultured tumour cells of the absorption adainst normal human cells; (d) conding the phage selected in the place in the place with at least two types of cultured normal cells; and c); (e) assaying the specificity of cloned phage by step (b) and (c); (e) assaying the specificity of cloned phage that do not bind conclude the place with a feast two types of cultured normal cells; or cultured tumour cells derived from more than one other tumour that is concluded the place in the place in the place in the place in the place of continuour cells derived from more than one other tumour that is concluded as described above. The antibodies produced can be used for a method as described above. The antibodies produced can be used for chain antibodies have low immunogenicity in humans compared to murine monocolonal antibodies (Mabs). Since the antibodies are isolated from fusion phage libraries, their affinity and specificity for a cumour cell inne can be improved by genetic manipulations.
                                                                                                                                  .

This sequence is derived from the nucleotide sequence encoding the heavy chain variable region. The "x" residues represent nonsense codons. The coding sequence has been translated in all 3 reading frames (see also R1213 and R12133).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         27-MOV-1997 (first entry)

This polypeptides sequence comprises the VH domain of human scrv antibody 182 (also known as 7A3), which is specific for antibody 182 (also known as 7A3), which is specific for antibody 182 (also known as 7A3), which is specific for transforming growth factor (TGF) beta-1. It is encoded by a gene (TG0380) isolated from a peripheral blood lymphocyte library. The antigen-binding domains of human antibodies (see W1552-40) to TGF beta-1 and/or beta-2 can be used to counter the adverse effects of TGF beta, such as (i) promotion of fibrosis (in dermal, ocular or keloid scarring, lung fibrosis, arterial injury, proliferative inver cirrhosis, post myocardial infarction, post-angioplasty restenosis, scleroderma, vascular disorders, cataract, glaucoma, or setenosis, scleroderma, vascular disorders, cataract, glaucoma, or steporosis), or (ii) immune and inflammatory diseases (theymatorid arthritis, macrophage deficiency diseases or macrophage pathogen infarting and VL can be infection). Nucleic acids encoding human antibody VH and VL can be infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 adsvkgrftisrdnskntlylqmnslraedtavyycaktge-ysgydssg-vdvwgkgtt 118

The MAb is of subclass 1gG4 and binds to lymphokines/monokines with an affinity of 10(9)/M. The Mab or fragment (FV, single-chain FV, Fab or F(ab') is used in the treatment of inflammation e.g. rheumatoid arthritis, osteoarthritis and inflammatory bowel diseases, and in the treatment or psortal inflammatory bowel diseases, and in disease and tumours. The MAb or fragment can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 EVULLESGGGVVÜPGRSLFLSCAASGFTFKTYGMHWVRUAPGKGLEWVAGLSFDGSNUYY 60

Example 13: Figure 11A; 116pp; English.

Example 13: Figure 11A; 116pp; English.

A novel recombinant DNA molecule which encodes a single chain fusion protein or antibody comprising the FV region of both the light and heavy chains of an antibody (Ab) fused together, and an effector molecule, where the fusion protein or Ab has the binding specificity of monoclonal Ab (MAb) B1, B3 or B5, can be used for the production of such fusion proteins or antibodies. The fusion proteins can be used in compositions as an immunotoxin to inhibit tumour cell growth the single chain antibody can be used to detect the presence or The single chain antibody can be used to detect the presence or patient. The antibodies are also useful as multiple targetting moleties, providing at least 2 kinds of biological activity. They moleties, providing at least 2 kinds of biological activity. They can also be used in diagnostic assays and for the imaging of tumours when attached to a radiolabel and for the pathological diagnosis of tumours. Humanised antibodies are less immunogenic than the mouse was an and by the mouse that the mouse and the mouse of the pathological diagnosis of the pathological diagnosis of the pathological pathological diagnosis of the pathological control of the mouse that the mouse of the pathological diagnosis of the pathological diagnosis of the pathological control of the pathological control of the pathological control of the pathological diagnosis of the pathological diagnosis of the pathological diagnosis of the pathological diagnosis of the pathological control of the pathological control of the pathological diagnosis of the pathol

claim 16; Fig 1a(11): 184pp; English.

This polypeptide comprises the VH domain of human scryv antibody
20 31G9, which is specific for transforming growth lactor (7GF)
21G9, which is specific for transforming growth lactor (7GF)
21G9, which is specific for transforming growth lactor (7GF)
21G9, which is specific for transforming growth lactor of human soft human control is ingle chain Fv library. The antigen-hindron domains of human context the adverse effects of TGF beta, such as (1) promotion of fibrosis (in dermal, ocular or keloid scarring, lung fibrosis, of fibrosis (in dermal, ocular or keloid scarring, lung fibrosis, of fibrosis dault respiratory distress syndrome, liver cirrhosis, post adult respiratory distress syndrome, liver cirrhosis, post upcompande deficiency adactors, cataract, glaucoma, or esp. neural scarring and pomerulomephritis, also (not claimed) osteoporosis, or (11) manne and inflammatory diseases (e.g. rheumatoid arthritis.

Nucleic acids encoding human antibody VH and VL can be used for prodn. of recombinant antigen-binding domains. These are highly and low 1050s for neutralisation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            21-MAY-1992 (first entry)
Heavy chain VH3.5 from BSA binding scFv fragment.
Heavy chain VH3.5 from BSA binding scFv fragment; coat:
Fd; bacteriophage, gene III; filamentous; phagemid; capsid; coat:
pilus; g3p; binding; adsorption; gene VIII; diverse repertoire;
specific binding pairs; replicable genetic display package; human.

Method of resurfacing of rodent antibodies to produce humanised antibody forms - for producing non-human antibodies with improved therapeutic efficiency by presenting human surface on V-region Example 1, Fig 4B, 230pp; English.

Modification of a rodent antibody (Ab) or fragment by resurfacing in order to produce a humanised rodent Ab can be determined by calculating homology between murine and human Ab antibody surfaces. In order to test the resurfacing approach of the invention, three humanisation experiments were set up: (1) traditional loop grafting, (2) resurfacing approach using most similar chain; and (3) resurfacing approach using human sequences with most similar surface residues. The Ab used was the murine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         anti-N901 Ab (see R2004). Experiment 2 was carried out using the present sequence which represents the human G36005 Ab heavy chain variable region with 89 percent homology with anti-Na01 Ab N901/G36G05 (P52065) was prept. by CDR grafting. Sequence numbering starts at 11% in the

96 clones analysed, 43 showed binding to both phox:RSA and BSA. Thirteew were designated BSA binders. Thirteen of fourteen clones sequenced had the same sequence, the VH derived from a human VH3 family gene (shown here) and the VL from a human VH4 family gene (R2552). The other was derived from a human VH4 family gene and a human VH4 family gene. One clone bound only to phox:BSA (oxazolono binder). This sequence revealed a VH derived from a human VH1 family gene (R22569) and VL from a human V lambda I family gene (R2550). See also P21560.307, 309.312, P22450, P22565, P22567.81

Example 8: Column 15-18; 25pp; English.

Example 8: Column 15-18; 25pp; English.

This is the amino acid sequence of the heavy chain variable (Vh) region from the human monoclonal antibody (MAD) PEI-1. The MAD was generated by immunising humans with a hepatitis B virus (HRV) varcine, isolating peripheral Brood lymphocytes (PPL) and fusing them with a mouse/human xenogeneic cell line SPAZ-4. 5 cell lines were isolated: PFI-1, ZMI-1, ZMI-2, MD3-4 and LO3-3. The cell lines were then tested for production of an anti-hepatitis B virus surface antigen antibody by ELISA The MADs are then purified from large scale cell culture by protein A chromatography, size separation on Sephacryl S300 qel and ion exchange
                                                                                                                                                                                                                                                    80 adsvkgrftisrdnskntlflqmhslraadtgvyycakdqlyfgsqspghy---wvqgtl 136

Claim 19; Page 62: 87pp; English.

A process for isolating and synthesising human monoclonal anti-tumour antibodies has been produced. The process involves: (a) constructing at antibodies has been produced. The process involves: (a) constructing at least one fusion phage library from the peripheral blood lymphocytes (PBLS) of a cancer patient; (b) screening for anti-tumour antibodies in the phage library in a binding assay with cultured unmour rolls of the same type as the patient; (c) removing extraneous antibodies in same type as the patient's tumour; (c) removing extraneous antibodies in incubating the phage with at least two types of cultured normal cells; and (f) further testing the specificity of cloned phage that do not bind and (f) further testing the specificity of coloned phage that do not bind to either cell line of cultured normal cells in further binding assays to cultured tumour cells derived from more than one other tumour that is
chromatography on Q-Sepharose. The heavy and light chains of the Mabs were isolated and their amino acid sequences determined. Primers were generated and used to amplify cDNA synthesised from RNA purified from accordance of the heavy and light chains (nucleic acid and amino acid) from Mabs PEI 1, 2Ml 1, 2Ml 2, and MNS-4 shown in 185838-45 and W2494-91. The Mabs PEI 1, 2Ml 1, 2Ml-2 and MNS-4 brown in infections in immunosuppressed patients or patients with chronic active hepatifis, especially liver transplant patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           not the patient's tumour. The present sequence represents a human heavy chain antibody, from an scFv antibody tusion phage library, produced by a method as described above. The antibodies produced can be used for diagnostic and therapeutic applications and for isolating tumour antigens for studying tumouriquenesis of for use as anti-cascer vaccines. The human antibodies have low immunogenicity in humans compared to murine monoclopial antibodies (MAbb). Since the antibodies are isolated from fusion phage libraries, their affinity and specificity for a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     80 adsvkgrftisrdnskntlflgmhslraadtgvyycakdqlyfgsgspqhy---wvgqtl 136

MD3-4, ZM1-1 and PEL1-1 hybridoma cell lines were derived from 12, ZM1-1 and PEL1-1 hybridoma cell lines were derived from 14 mbocytes of individuals immunised with Heptavax (Merck & Co). Antibodies PEL1-1, ZM1-1 and MD3-4, belong to the Iggl cids. The cell lines producing PEL1-1, ZM1-1 and ZM1-2 were deposited as AFC FM924, 9191 and 9192 respectively. The cell lines all behave as typical (mouse x human) x human hybridomas and produce their respective Abs in concs. ranging up to 25 mg/l in standard suspension culture. The heavy variable (VH) and light variable (LH) sequenced. Total RNA was extracted from 10(7) hybridoma cells

PCRS were performed and amplified DNA was size selected. ss DNA for sequencing was isolated from each positive clone after superinfection with MI3K07.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence of the VH region of monoclonal antibody PE1-1 against hepatitis B virus surgace antigen.
